Accessible Links

Inclusion Toolkit

What is it for?

Links need descriptive text so everyone can understand them. While 'click here' links might work visually, people using assistive technology often scan links out of context and will just hear a repetitive list.

You should also avoid using raw uniform resource locators (URLs), as screen readers read out the whole address, including symbols, which is annoying and disorientating.

How to support it

Link text must clearly describe its destination without context. If it's inside a sentence, make sure it flows well while remaining informative.

You should always avoid vague phrases like 'here', 'click here', 'read more', and 'more information'.
