Hover States

Abi Harrison-Nye

What is it for?

Hover states are what happen when a mouse pointer moves over an interactive element. Interactive elements include things like links, buttons, and inputs.

Hover states must also follow all the usual accessibility guidelines. For instance, content that appears on hover or focus must stay visible when the pointer moves onto it, and Escape must close it.

How to support it

If you're building or designing a new component, make sure it has hover states that follow all accessibility guidelines (for example, colour contrast, target size, descriptive text, and so on)
